ABSTRACT:

A system and method for a reporting information service using metadata to communicate with databases and a user interface. The invention includes software in a data access component, a report component, and a user interface component for populating, maintaining, and dispatching reports responsive to user requests for the reports via metadata. The data access component provides a logical view of data in a database via data access metadata. The report component populates, maintains, and dispatches reports via report metadata characterizing the reports. The user interface component renders the report dispatched from the report component via user interface metadata specifying rendering attributes for the report.

ABSTRACT:

According to the invention, a database combining module, such as a software on a server, is used together with a resource manager software of a disk storage system in which a database is stored. A resource allocation for the disk storage system is determined to satisfy specifications requested by a user provided to a database combining module. Host paths and volumes are allocated and snapshots are controlled based on the processing of these software modules.
